CAPSTONE 33

AI Weekly Planner and Task Prioritiser

Proposed tracking week: 26 Oct–1 Nov 2026

Objective

Convert a 25-task backlog into a realistic, prioritised weekly plan; verify schedule feasibility; compare three AI tools; and measure completion honestly.

Method

Use task cleanup, Eisenhower-style prioritisation, time-blocking, breaks, a weekend buffer and a daily completion log.

Deliverables

25-task list; editable tracker; final weekly plan; completion log and metrics; one-page template; prompt library; verification checklist; before/after analysis; three candidate plans; comparison worksheet; ICS draft; demo script.

Responsible AI checks

Verify deadlines; avoid invented facts; protect private information; check overlaps and durations; manually inspect calendar imports; keep human override.

Evidence status

The actual ChatGPT/Gemini/Claude outputs and observed one-week completion results are not yet collected. The tool-comparison worksheet is intentionally blank, and no completion percentage is claimed.

Next steps

Run the same prompt in all three tools, save genuine outputs, score them in the workbook, verify actual deadlines, and update completion records after the tracking week.
